VOLUME 5 AIRMAN CERTIFICATION

CHAPTER 2 TITLE 14 CFR PART 61 CERTIFICATION OF PILOTS AND FLIGHT INSTRUCTORS

Section 1 General

Source Basis:

- **Title 14 CFR Part 3 Subpart C, Designated U.S. Agents for Service.**
- **Title 14 CFR § 61.5, Certificates and Ratings Issued Under This Part.**
- **Title 14 CFR § 61.23, Medical Certificates: Requirement and Duration.**
- **Title 14 CFR § 61.45, Practical Tests: Required Aircraft and Equipment.**
- **Title 14 CFR § 61.56, Flight Review.**
- **Title 14 CFR § 61.57, Recent Flight Experience: Pilot in Command.**
- **Title 14 CFR § 61.64, Use of a Flight Simulator and Flight Training Device.**
- **Title 49 U.S.C. § 40101, Policy.**
- **Title 49 U.S.C. § 40102(a), General Definitions.**
- **Title 49 U.S.C. § 40125, Qualifications for Public Aircraft Status.**
- **Title 49 U.S.C. § 44703, Airman Certificates.**
- **Public Law 106-424, National Transportation Safety Board Amendments Act of 2000.**

5-216 PURPOSE. The sections within Volume 5, Chapter 2 provide instructions, standards, and procedures for evaluators to administer a certification test that leads to a certificate and/or rating.

A. Evaluator. For the purpose of this chapter, the term "evaluator" applies to all of the following, as appropriate:

- Aviation safety inspectors (ASI);
- Pilot examiners (other than Administrative Pilot Examiners (Admin PE));
- Training Center Evaluators (TCE);
- Chief instructors, assistant chief instructors, or check instructors of pilot schools holding examining authority; and
- Instrument flight instructors conducting an instrument proficiency check (IPC).

B. Examiner. The term "examiner" as used in the practical test standards (PTS) is synonymous with the term "evaluator" as used in the Airman Certification Standards (ACS) and the sections within Volume 5, Chapter 2.

5-217 CONTENT.

A. General Aviation (GA) Evaluations and Certification Functions. This chapter's guidance pertains to GA evaluations and certification functions. It does not apply to airman certification or demonstrations of competency for applicants engaged in operations under Title 14 of the Code of Federal Regulations (14 CFR) parts 91 subpart K (part 91K), 121, and 135. It also does not pertain to the conduct of knowledge tests. The conduct of knowledge

tests is covered in Federal Aviation Administration (FAA) Order 8080.6, Conduct of Airman Knowledge Tests.

B. Definitions. It is recognized that guidance and directive information has been previously defined in Volume 1, Chapter 1, Section 2. However, as this chapter's guidance is employed by all evaluators, not just ASIs, the following definitions apply:

1) Information considered directive in nature is described using the terms "shall" and "must," indicating the actions are mandatory.

2) Prohibited actions are described by the use of "shall not" or "must not."

3) Guidance information is described with the term "may," indicating the actions are desirable or permissive, but not mandatory.

5-218 THE AIRMAN CERTIFICATION PROCESS.

A. Certification Process and Applicant Certification Functions. An applicant for an airman certificate or rating must accomplish the steps in a specific process before certification is complete. These steps include:

1) An applicant for a practical test must arrange to take the appropriate test with an evaluator, as defined above.

2) The applicant must satisfactorily complete an application in the Integrated Airman Certification and Rating Application (IACRA); or a paper FAA Form 8710-1, Airman Certificate and/or Rating Application; FAA Form 8710-11, Airman Certificate and/or Rating Application—Sport Pilot; or FAA Form 8710-13, Remote Pilot Certificate and/or Rating Application, as appropriate.

3) The applicant must present to the evaluator all documents necessary to demonstrate eligibility to take the test. These documents may include an applicant's pilot logbook or training record to demonstrate required aeronautical experience, endorsements, graduation certificates, and knowledge test (Airman Knowledge Test Report (AKTR)) results. Specific eligibility criteria can be found in the section of this chapter that corresponds to the test being administered.

4) Applicants with a foreign address for official record purposes must comply with the U.S. agent for service requirements in 14 CFR part 3 subpart C, which require any individual who has a foreign address and no U.S. physical address of record on file with the FAA to designate a U.S. agent for service if they apply for a certificate, rating, or authorization issued under 14 CFR part 47, 61, 63, 65, 67, or 107, or hold a certificate, rating, or authorization issued under any of these parts. To designate a U.S. agent for service, applicants should refer to Advisory Circular (AC) 3-1, U.S. Agents for Service on Individuals with Foreign Addresses Who Hold or Apply for Certain Certificates, Ratings, or Authorizations.

5) The applicant must provide an aircraft appropriate to the certificate or rating sought, as described in paragraph 5-219 below.

6) The applicant must pass a practical test appropriate to the certificate or rating sought.

B. Evaluator Certification Functions.

1) Personal Prejudices. An evaluator must not allow personal prejudices to interfere with the objective evaluation of an applicant. If a personality conflict or disagreement develops between the evaluator and the applicant before any unsatisfactory performance by the applicant, the evaluator or the applicant may discontinue the practical test. In this case, the evaluator issues a Letter of Discontinuance.

2) Appointments. An evaluator is expected to honor appointments unless special circumstances warrant cancellation or postponement. If the cancellation or postponement is at the evaluator's request, it is the evaluator's responsibility to reschedule the practical test. If an evaluator cancels a practical test without rescheduling, the evaluator should recommend another evaluator or instruct the applicant to contact the responsible Flight Standards office. The responsible Flight Standards office will provide the names of other evaluators for the area or may arrange to conduct the practical test if the applicant requests it.

3) Test Environment. The evaluator must conduct the oral portion of the practical test in a private area free from distractions. The evaluator must give the applicant their undivided attention during the test and ensure that any discussion of test results with the applicant is in private.

4) English Language Skill Standards. The evaluator must determine that the applicant meets the FAA Aviation English Language Standard (AELS). An applicant for an FAA certificate or rating must be able to communicate in English in a discernible and understandable manner with air traffic control (ATC), pilots, and others involved in preparing an aircraft for flight and operating an aircraft in flight. This communication may or may not involve radio communications. As such, an applicant for an FAA certificate issued in accordance with 14 CFR part 61, 63, 65, or 107 who cannot hear or speak due to a medical deficiency may be eligible for an FAA certificate with specific operational limitations. For additional information, refer to AC 60-28, FAA English Language Standard for an FAA Certificate Issued Under 14 CFR Parts 61, 63, 65, and 107. If the applicant's ability to meet the FAA AELS comes into question before starting the practical test, the evaluator shall not begin the practical test. An evaluator who is not an ASI must check the "Referred to FSO for Aviation English Language Standard Determination" box located on the bottom of page 2 of the applicant's FAA Form 8710-1 or FAA Form 8710-11, as applicable. The evaluator shall refer the applicant to the responsible Flight Standards office. If the applicant's ability to meet the FAA AELS comes into question after the practical test begins, an evaluator who is not an ASI shall discontinue the practical test and check the "Referred to FSO for Aviation English Language Standard Determination" box on the application. The evaluator shall also issue FAA Form 8060-5, Notice of Disapproval of Application, with the comment "Does Not Demonstrate FAA AELS" in addition to any unsatisfactory task(s). The evaluator shall refer the applicant to the responsible Flight Standards

office. ASIs conducting the practical test may assess an applicant's English language proficiency in accordance with Volume 5, Chapter 14, Section 1. In either case, the evaluator must complete and submit the application file through normal application procedures and notify the responsible Flight Standards office of the referral.

C. Review of a Designee Evaluator's Decision. An applicant who disagrees with a designee evaluator's decision may request another practical test or evaluation from an ASI from the servicing Flight Standards office within 7 calendar days from the date of the practical test. The ASI assigned this evaluation will contact the Airmen Certification Branch (AFB-720) as soon as receiving the assignment to place the certification on hold until the evaluation takes place. Such evaluation consists of the complete test, including any areas of operation already approved by the designee evaluator. The applicant must prepare a new FAA Form 8710-1 or FAA Form 8710-11, as appropriate, and the ASI must complete a new certification file. Both evaluators' certification files are forwarded to AFB-720. The ASI's report determines if a certificate is issued. The ASI should discuss the test results with the designee evaluator and determine the validity of the designee evaluator's test.

D. Invalid Practical Tests That Resulted in Issuance of FAA Form 8060-4, Temporary Airman Certificate.

1) Permanent Certificate Has Not Been Issued. If an ASI has reason to believe that a test conducted was invalid, the ASI must notify AFB-720 as soon as possible to pause the processing of the application while investigating the conduct of the test. If the investigation establishes that the test was valid, the ASI will notify AFB-720 to continue processing the application. If the investigation determines that the test was invalid, the ASI must obtain written concurrence via a memorandum from the office manager before removing the application from the airman's record. If the office manager concurs, the ASI will notify AFB-720 to remove the application from the airman's record and forward a copy of the memorandum to them. The status of the Temporary Airman Certificate will be determined on a case-by-case basis with AFB-720, as it is a part of the application package that they are evaluating. The ASI will then contact the applicant to discuss the removal of the application and to help coordinate taking the practical test again with the same evaluator or another evaluator, depending on the circumstances for why the test was invalid.

2) Permanent Certificate Has Been Issued. Contact the office legal representative to discuss the circumstances of the test and to determine if the most appropriate action is a reexamination of the certificate under Title 49 of the United States Code (49 U.S.C.) § 44709 or legal enforcement to revoke the certificate.

E. Evaluator's Reversal of Practical Test Decision.

1) If the evaluator has issued FAA Form 8060-5 and subsequently determines the disapproval notice was issued in error, then the evaluator will use the corrected IACRA process found in Volume 5, Chapter 2, Section 4 as soon as possible so that the disapproval notice is not recorded in the applicant's record. The evaluator should then contact the applicant as soon as possible, issue a Letter of Discontinuance explaining what happened, and schedule the continuation of the practical test.

2) If the evaluator has issued FAA Form 8060-4 and subsequently determines the temporary certificate was issued in error, then the evaluator will contact their managing specialist immediately. The managing specialist will follow the procedures above for an invalid test.

F. Statement of Demonstrated Ability (SODA). If an evaluator accepts an application from an airman who has FAA Form 8500-15, Statement of Demonstrated Ability, the evaluator must verify the appropriate limitations relating to the SODA with the responsible Flight Standards office. Any appropriate limitations relating to operational privileges must be placed on any airman certificate issued.

G. Applicant's Training Record/Pilot Logbook. An applicant for a certificate or rating for which there are aeronautical experience requirements must present a reliable record to the evaluator that clearly shows the completion of those requirements. The evaluator must verify that the applicant meets all eligibility and experience requirements for the certificate or rating sought.

1) Where required by 14 CFR part 61, an authorized instructor's endorsement is required in the applicant's logbook or training record.

2) An authorized instructor's endorsement is required to show the training time completed for each session.

3) Where required by the rules in 14 CFR part 61, the applicant applying for an aircraft type rating or for the original issuance of an Airline Transport Pilot (ATP) Certificate in an aircraft requiring an aircraft type rating must have the appropriate endorsement in the applicant's logbook or training records from an authorized instructor.

H. Designee Evaluators Contacting the FAA for Assistance. If the applicant presents reconstructed records or U.S. military records, or the designee evaluator cannot positively determine the applicant's eligibility, the designee evaluator shall contact their responsible Flight Standards office for guidance.

I. Pilot Certificate Requirements and the Logging of Flight Time in Hang Gliders, Ultralights, Powered (Motorized) Gliders, and Other Vehicles. The following guidance is designed to clarify issues concerning the logging of flight time and minimum pilot certificate requirements for hang gliders, ultralights, and similar vehicles.

1) Logging Time. Unless the vehicle is type certificated as an aircraft that would require a rating listed in 14 CFR § 61.5(b)(1), is an experimental aircraft, or otherwise holds an Airworthiness Certificate, flight time acquired in such a vehicle may not be used to meet the requirements of 14 CFR part 61 for a certificate or rating or to meet recency-of-experience requirements.

2) Minimum Certificate Requirements. To operate a small aircraft with an experimental Airworthiness Certificate, at least a Student Pilot Certificate is required. The applicant's pilot logbook or training record must be properly endorsed in accordance with 14 CFR § 61.87, except in the case of an aircraft operating limitation that requires the pilot in command (PIC) to hold an appropriate category/class rating. In that case, the pilot must hold at least a sport pilot certificate or Private Pilot Certificate as appropriate for the aircraft being used.

3) Logging Time in Powered Gliders. Flight time in a powered glider cannot be logged as required airplane pilot flight time unless the aircraft is type certificated as an airplane. Flight time used to meet recency-of-experience requirements or the requirements for a certificate or rating may only be logged according to the category in which the aircraft is type certificated (e.g., airplane, glider, etc.). Powered gliders may be type certificated either as gliders or airplanes.

5-219 AIRCRAFT.

A. General. Per 14 CFR § 61.45, an applicant must furnish an aircraft of U.S. registry that is of the same category, class, and type, if applicable, for which the applicant is applying for a certificate or rating and that has a Standard Airworthiness Certificate or Special Airworthiness Certificate in the limited, primary, or light-sport category. As also permitted by 14 CFR § 61.45, at the evaluator's discretion, the aircraft may be a U.S. military aircraft, a properly certificated aircraft of foreign registry, or an aircraft with other than a Standard Airworthiness Certificate or Special Airworthiness Certificate in the limited, primary, or light-sport category, such as an aircraft with an experimental certificate that can be identified as a category and class of aircraft (if class of aircraft is appropriate).

B. Experimental Aircraft. An applicant may request a practical test in an experimental aircraft. The aircraft may be certificated as experimental for all purposes listed in 14 CFR § 21.191, except for air racing. An evaluator may conduct a practical test in such experimental aircraft provided that all the following conditions are met:

1) The evaluator is willing to conduct the test.

2) The applicant is not prohibited from accomplishing the required tasks by the operating limitations issued for the experimental aircraft.

NOTE: If the experimental aircraft is not capable of performing all required tasks, another aircraft of the same category, class, and type, as appropriate, must be provided for those tasks that cannot be accomplished in the experimental aircraft.

C. Self-Launch Gliders. Aircraft that have been certificated as gliders with self-launch capability cannot be used for a practical test for an airplane category. There are no dual airplane/glider category designations. The evaluator can determine the category of an aircraft by examining the aircraft Airworthiness Certificate or Type Certificate Data Sheet (TCDS). However, there is one notable exception: an experimental turbojet-powered glider can be used to meet the experimental aircraft requirements as outlined in 14 CFR § 61.58(d)(5).

D. Aircraft Limitations. A limitation will be placed on an applicant's pilot certificate if the applicant provides an aircraft that has operating characteristics that preclude it from performing all the tasks required during the practical test (per 14 CFR § 61.45(b)(2)). However, this situation and the kind of aircraft to be used must be specifically identified and approved by the FAA's General Aviation and Commercial Division (AFS-800), at 800 Independence Avenue SW, Washington, DC 20591 or 9-AFS-800-Correspondence@faa.gov, or the Delegation

and Resource Branch (AFG-970) for experimental light-sport aircraft (LSA), on a case-by-case basis.

1) The FAA generally disapproves the use of such aircraft, but it may grant approval on a case-by-case basis, such as in the case of a reasonable accommodation to an applicant with a disability requiring such accommodation.

NOTE: For example, in the past, AFS-800 has approved the Engineering and Research Corporation (ERCO) Ercoupe for use in a practical test. Persons seeking to use an Ercoupe for a practical test would receive the limitation "Limited to Ercoupe Without Rudder Pedals."

2) In accordance with 14 CFR § 61.45(f), a practical test may be conducted in an LSA that has a single-pilot station with certain limitations. The practical test for a sport pilot certificate can be conducted from the ground by an evaluator, provided the evaluator agrees to conduct the single-seat aircraft practical test, is in a position to observe the operation of the aircraft, and can evaluate the proficiency of the applicant. Finally, the evaluator must ensure that the practical test is conducted in accordance with the appropriate sport pilot PTS/ACS for single-seat aircraft. Upon successful completion of the practical test, the following limitation will be placed on the sport pilot certificate: "NO PASSENGER CARRIAGE AND FLIGHT IN A SINGLE-PILOT STATION AIRCRAFT ONLY." Only a designee or an ASI is authorized to remove the limitation. This can be accomplished when the sport pilot takes a practical test in a two-place LSA and conducts additional tasks identified in the PTS/ACS. It can also be accomplished if the sport pilot completes the certification requirements for a higher certificate, rating, or privilege in a two-place aircraft. A sport pilot who is issued a certificate with a single-seat limitation must complete a flight review, as required by 14 CFR § 61.56. If the flight review will be accomplished in an aircraft, it must be in an aircraft with a minimum of two seats, in which the pilot is rated, and with an authorized instructor that is current and qualified to act as PIC.

E. Public Aircraft. In accordance with 49 U.S.C. § 40102(a)(41), public aircraft are aircraft owned and operated by a state government, the District of Columbia, or a territory or possession of the United States or a political subdivision of one of those governments, except as provided in 49 U.S.C. § 40125(b). Section 40125(b) provides, in pertinent part, that an aircraft described in § 40102(a)(41)(A), (B), (C), (D), or (F) does not qualify as a public aircraft under such section when the aircraft is used for commercial purposes or to carry an individual other than a crewmember or a qualified noncrewmember.

1) Public aircraft that do not hold an FAA Airworthiness Certificate are not authorized for use in a practical test. A pilot may not use a public aircraft that does not hold an FAA Airworthiness Certificate for a practical test or for maintaining recency of experience under 14 CFR part 61.

2) In accordance with Public Law (PL) 106-424, National Transportation Safety Board Amendments Act of 2000, Section 14, Crediting of Law Enforcement Flight Time, if a pilot for a Federal, state, county, or municipality law enforcement agency is engaged in a law enforcement flight activity in a public aircraft, the pilot may log that flight time for the purposes

of 14 CFR § 61.51(a)(1) and (2). However, in accordance with PL 103-411, Independent Safety Board Act Amendments of 1994, and 49 U.S.C. § 40102, a public aircraft is not authorized to be used for the purposes of receiving pilot training for the furtherance of a certificate, rating, or recency of experience or for conducting a practical test for an airman certificate or rating.

3) The prohibition on conducting a practical test in a public aircraft does not apply to military aircraft (see Volume 5, Chapter 1, Section 4 for further information).

F. Aircraft Equipment.

1) Required Controls. Per 14 CFR § 61.45(c), an aircraft used for a practical test (other than lighter-than-air) must have engine power and flight controls that are easily reached and operable in a conventional manner by both pilots, unless the evaluator determines that the practical test can be conducted safely without the controls easily reached by the evaluator.

2) Aircraft with Stability Control Augmentation Systems. Some aircraft are equipped with stability and augmentation systems which are designed to operate at all times when the aircraft is in flight. Aircraft equipped with such devices may be used on practical tests if they are operated in accordance with the manufacturer's recommendations and the appropriate operating limitations.

G. Flight Simulation Training Devices (FSTD).

1) Flight Training Devices (FTD) and Full Flight Simulators (FFS). Only FTDs Level 4 through 7 and FFSs Levels A through D are authorized for use on a practical test, and only as specified in the applicable PTS/ACS. All FSTDs used for training must be qualified and approved in accordance with 14 CFR part 60. In accordance with 14 CFR § 61.64, an FSTD may only be used for the practical test in accordance with an approved course of training under 14 CFR part 121, 135, 141, or 142. Contact the Training and Simulation Group (AFS-280) with any questions concerning the permitted tasks when using FSTDs on practical tests. Additionally, applicants are not required to have a valid medical certificate when accomplishing a practical test in an FSTD. (Refer to 14 CFR § 61.23(b)(10).)

2) Aviation Training Devices (ATD). ATDs are qualified and approved as either a basic aviation training device (BATD) or an advanced aviation training device (AATD). Their approval is in accordance with 14 CFR § 61.4(c) and AC 61-136, FAA Approval of Aviation Training Devices and Their Use for Training and Experience. Evaluators must not use an ATD to conduct any part of a practical test.

5-220 EVALUATING SINGLE PILOT RESOURCE MANAGEMENT (SRM) SKILLS. Emphasis must be placed on evaluating SRM skills, including judgment and aeronautical decision-making (ADM) skills. New flight training and evaluation methods have been developed to enhance these skills in order to reduce GA accidents. New techniques and methods for measuring the applicant's SRM skills are also needed to ensure the SRM skills are being mastered. Scenarios are the recommended method for both training and evaluating SRM skills. Developing a scenario that will effectively evaluate all required tasks of an appropriate PTS/ACS may present a challenge to the evaluator. The following information should help with this development.

A. What is a Scenario? Air carriers call them Line-Oriented Flight Training (LOFT); the military calls them sorties. There are at least two requirements for a scenario. The flight must have a purpose (reason to go) and consequences if the flight is not completed. Scenarios, as typically used in flight training, set up a set of circumstances that can be used to teach a specific (canned) response to an in-flight event. For example, an engine failure in flight in a single-engine airplane will require a response to pitch for best glide speed as quickly as possible. This method may be effective in teaching a critical response to the failure, but it does not promote the development of critical thinking skills and would not be useful in evaluating them. This example may be effective in evaluating a response to this emergency situation, but it would not allow an evaluator to observe the applicant's SRM skills. For a practical test, a scenario is a single flight that is planned and carried out. This flight, plus triggering events that the evaluator implements during the flight, should allow the applicant to demonstrate most of the required areas of operation and associated tasks for the practical tests with minimum disruptions.

NOTE: A trigger event is when the evaluator introduces an event or situation that requires the applicant to consider the event and/or take some action.

B. Training/Evaluating SRM Skills. For the purpose of training and evaluating SRM skills:

1) A scenario is a flight that the applicant could and may do with the certificate or rating they are seeking. For example, the private pilot applicant is planning a flight to an airport 50 miles away to pick up a relative and fly them to another town to attend another relative's graduation, and then fly them both back to the original departure airport for a celebration. This scenario has a purpose: to take the applicant and their relatives to the graduation and the celebration following. It will also very likely have consequences if the flights are not accomplished, such as the relatives' presumed disappointment.

2) The scenario should be something that the applicant may want to do, and it should provide opportunities to complete the various tasks required in the appropriate PTS/ACS. If the scenario is something the applicant is likely to do, it is likely that the applicant will take a real interest in making the flight and will not simply treat it as a training or evaluation exercise.

3) The scenario should be a complete flight that includes the preflight planning, the flight, and the postflight phases appropriate for the certificate or rating being sought.

C. Testing Environment. The scenario should allow the evaluation of the appropriate required areas of operation, tasks, and SRM skills during the course of the scenario with minimum disruptions. In other words, develop a scenario that incorporates as many of the required tasks as you can within a realistic setting. This statement is not meant to limit or restrict the evaluator's plan of action (POA), but rather it should be considered a goal for which the evaluator should strive. Fewer interruptions will enhance the quality of the evaluation and provide a better testing environment for the applicant to demonstrate their aeronautical skills (both SRM and psychomotor).

1) Many factors may cause a need to suspend the scenario to accomplish required tasks. For example, the scenario may call for a flight over a duck pond to count the number of

ducks (turns around a point). The evaluator may suspend the scenario to accomplish other maneuvers, such as the climb to altitude and demonstration of stalls, while they are at a place where the other tasks or maneuvers can be done safely and efficiently. Many required tasks are not normally conducted during a normal flight (e.g., steep turns); therefore, these tasks are more appropriately done during a break in the scenario. It is desirable to include situations within the basic scenario that would accommodate most tasks and maneuvers.

2) Keep in mind that trigger events will likely alter the flight planned by the applicant, and several required areas of operation may fit in the altered flight. For example, a trigger event prompts the applicant to divert to a shorter runway that also has obstacles at the approach and/or departure end. In this case, a trigger event that leads to a diversion would be built into the evaluator's POA but not provided to the applicant for flight planning if the applicant is to be evaluated on the ADM skills required to respond to the change in the scenario and to take relevant appropriate actions.

3) Because there are numerous possible responses to a given situation, the evaluator will need to consider the possible responses the applicant may apply to an event. For example, if the evaluator has given the applicant a simulated alternator failure and the applicant has decided to divert to the nearest airport, the applicant may decide to divert to an airport that does not allow the evaluator to accomplish the type of approach or type of landing the evaluator planned to accomplish next. The POA must allow the applicant to make a decision on an event or situation that has occurred (the trigger event), and then carry that decision to a logical conclusion. Since malfunctioning equipment typically does not resolve itself, the airplane must land. For the sake of this discussion, the decision to divert was good, and the choice of airports was okay, but not necessarily the best choice. The applicant's decision should be evaluated on whether the applicant achieved an appropriate safe outcome and whether the outcome was ever in doubt, not on whether the applicant chose to do what the evaluator would have chosen.

D. POA. Develop a POA that, as much as practical, covers all required areas of operation and associated tasks and provides the evaluator the opportunity to evaluate the applicant's SRM skills. The technique for evaluating SRM skills is to introduce an event or situation, called a trigger event, which requires the applicant to consider the event and/or take some action.

1) One way the evaluator can control the applicant's range of options or choices is to present the event or situation at a position/time where the obvious choice (e.g., the decision to divert the desired airport) is the only reasonable one. The evaluator may need to create and provide additional circumstances that would limit the applicant's choices. For example, an airport's runway is closed for repair. This circumstance should be a part of the initial planning factors known to the applicant and should not be a surprise provided during the execution of the diversion. Failure by the applicant to consider these factors during the flight would be a factor the evaluator considers in the evaluation.

2) Note that advanced avionics may make it difficult for the evaluator to provide realistic diversion circumstances. For example, the evaluator may want to eliminate one or more airports as potential diversion airports by providing weather that is below minimums; however, during the decision process, the applicant may obtain an updated weather report through installed

advanced avionics that give good weather reports for the airports involved. On the other hand, the applicant's SRM skills may be deemed unsatisfactory if the applicant fails to use the advanced avionics or other sources of information during the decision process. This evaluation will most likely depend on how much time the applicant has to make the decision.

E. Evaluating Aeronautical Skills: Developing a Scenario for Evaluating an Applicant's Aeronautical Skills During a Practical Test. The previous subparagraphs describe the reasons and considerations of a scenario, but the following guidance describes methods for the development of scenarios for evaluating applicants' aeronautical skills.

1) The process should begin with the development of a list of the required tasks, including the SRM tasks, in accordance with the appropriate PTS/ACS.

2) Next, create a scenario that will encompass as many of the required tasks as you can. The scenario should include the reason or purpose of the flight. If the purpose of the flight cannot be tailored to a specific applicant, it must be at least realistic. This is to entice the applicant to strive to complete the scenario, which should lead to a more realistic evaluation of the applicant's SRM skills. The scenario will need to include the trigger events that will ensure that the pilot demonstrates the required tasks and cause the applicant to take some action that will allow opportunities to evaluate SRM skills. Revise the scenario as needed to make this a workable POA as a natural evolution of the plan or to meet the needs for the specific candidate.

3) Finally, produce the written POA. Evaluators should develop multiple scenarios for each practical test they are authorized to conduct, because instructors and applicants will otherwise determine that an evaluator uses the same scenario for each practical test. Applicants would likely then plan for the anticipated scenario, which would defeat the purpose of the applicant making decisions and demonstrating SRM.

4) Additional information and guidance on SRM training and evaluation may be found on the FAA/Industry Training Standards (FITS) website at https://www.faa.gov/training_testing/training/fits/training.

5-221 ADMINISTERING THE PRACTICAL TEST—POAs.

A. General (All Tests). The purpose of this paragraph is to provide official policy and guidance to evaluators in developing an effective written POA that conforms to FAA policy, regulations, and the PTS or ACS, as appropriate. It is not appropriate to administer a written test during the oral examination.

1) Evaluators must administer each test in English using a written POA.

2) Each POA must contain the required pretest, preflight, and postflight briefings. The evaluator must provide all three briefings to the applicant, regardless of the applicant's background and experience or the evaluator's history with the applicant. The elements that must be contained in each briefing are included in paragraph 5-222 below.

3) There is no formal division between the oral portion and the flight portion of the practical test. However, the majority of oral questioning occurs during the ground portion of the

test. The POA may be devised in any sequence deemed appropriate by the evaluator, but the ground portion must be satisfactorily completed prior to the flight (or FSTD) portion of the test. (This does not mean that if an evaluator continues testing during the flight portion, the applicant cannot be found unsatisfactory on an oral or ground task.)

NOTE: The ATP/Type Rating practical test is different from other practical tests, in that there are two distinct places on FAA Form 8710-1 to indicate practical test results: one for the ground/oral portion and one for the aircraft flight check portion. It is common for two different individuals to administer the practical test: one completing the ground portion and one completing the flight portion of the test.

4) Each POA must include scenarios. Each practical test will include an overall scenario, providing the applicant with a reason to take the flight. As an example, if the evaluator is developing a POA for an initial Commercial Pilot Certificate with an Airplane Multiengine Land (AMEL) rating prior to meeting the applicant for the test, the evaluator may offer the applicant the following scenario (the scenario may be adjusted for the local area, the make and model (M/M) of aircraft, passenger seating configuration, etc.).

SCENARIO: Your doctor friend needs to depart Phoenix Sky Harbor International Airport (PHX) on Friday afternoon, no later than 5 p.m. She has surgeries scheduled all day, so she doesn't feel that she'll be fit to fly. She hires you to fly her in her (insert M/M here) to a seminar in Dallas/Fort Worth, TX. She (123 pounds) is making a weekend out of it, so she will be bringing her husband (180 pounds) and daughter (120 pounds). The weather is forecast to be visual flight rules (VFR) all weekend. Plan a VFR cross-country flight.

5) The FAA is transitioning from the use of the PTS to ACS. Because not all practical tests are based on the same reference document, determine which reference document will be used. If the practical test is based on a PTS, the POA must be developed in accordance with the guidance contained in subparagraph 5-221B below. If the test is based on an ACS, continue with subparagraph 5-221C below.

B. Tests Based on the PTS.

1) A POA must include, at a minimum, each area of operation as well as the associated and appropriate tasks to be tested. If a task is tested, it must be tested in its entirety. This means that each element included within that task must be tested and satisfactorily completed in order to consider that task complete. Additionally, each PTS contains a list of "Special Emphasis Areas." These areas are considered critical to flight safety and must be tested by the evaluator. For example, the evaluator may plan to have the applicant divert to an airport that conducts land-and-hold-short operations (LAHSO). If the applicant elects to divert to a different airport than the evaluator had planned, LAHSO will need to be tested through additional oral questioning. Refrain from testing Special Emphasis Areas by rote questioning (e.g., "what is CFIT?").

2) The flight from Phoenix to Fort Worth described above (transporting the doctor) is the overall scenario (reason and circumstances) for the flight in that example. However, while developing the POA, incorporate each of the tasks from the PTS into the scenario. For example, the current FAA-S-8081-16, Commercial Pilot Practical Test Standards for Rotorcraft Category Gyroplane Rating, Area of Operation I, Task A is titled "Certificates and Documents." This task requires the applicant to demonstrate knowledge on the following elements:

a) Explaining:

1. Commercial Pilot Certificate privileges and limitations, and recent flight experience requirements.

2. Medical certificate class and duration.

3. Pilot logbook or flight records.

b) Locating and explaining:

1. Airworthiness and registration certificates.

2. Operating limitations, placards, instrument markings, and gyroplane flight manual.

3. Weight and Balance (W&B) data and equipment list.

3) In developing the POA, the evaluator must continue with the scenario during testing. For example, the evaluator may cover Task A, element 1 in the following manner (other than privileges and limitations, which will be visited later in the scenario):

> SCENARIO: The doctor called her insurance company to ensure that you will be covered to fly her aircraft. The insurance company needs you to demonstrate that you are current and qualified to take the flight in this (insert M/M). What information will you provide?
>
> NOTE: If the applicant does not volunteer all the required information, the evaluator must provide followup questions (e.g., "If we depart at 5 p.m., what time does your planning show that we will arrive?"). These followup questions will evaluate the airman's knowledge of night currency.

4) After the applicant provides an adequate explanation of their recent flight experience and medical certificate class and duration, the evaluator may test the element pilot logbooks or flight records by asking the following:

> SCENARIO: The doctor asks, "How do you keep track of all that? I fly the aircraft quite a bit, but I don't write any of that down. Are you required to?"

5) Followup questions might include:

- What specific information must be recorded?
- Does it have to be in a logbook like that or can I keep the record on my "Hobbs Log?"
- Is there a rule that requires that?

6) In order to test element 2, the evaluator might ask:

SCENARIO: Both the doctor and her insurance company are satisfied that you meet the requirements to fly the aircraft under her "open pilot clause." You agree to meet the doctor at her hangar to check the status of the aircraft. Before you begin a preflight inspection, you want to check that all the required paperwork is on board the aircraft. What are you looking for?

NOTE: Again, if the applicant does not provide all the information that is sought (in order to cover every element), the evaluator must ask followup questions.

7) If the applicant includes information about required inspections, etc., the evaluator must allow the applicant to provide whatever information they feel is relevant. This may help cover Task B, Airworthiness Requirements.

SCENARIO: While reviewing other paperwork, the doctor begins telling you about all the "mods" she has had done to the aircraft. The aircraft has a Supplemental Type Certificate (STC) to increase available horsepower. You want to make a note of this, and notice that the manifold pressure gauge has different markings than the (insert M/M) that you are accustomed to flying. Where do you look for further information?

SCENARIO: Part of the STC requires that two new placards are installed. You find that they aren't there. How do you handle this?

NOTE: If the applicant has a good understanding, and with the use of good followup questions, this will adequately cover operating limitations, placards, instrument markings, pilot's operating handbook (POH)/Aircraft Flight Manual (AFM), W&B data, and equipment list.

SCENARIO: Back to the paperwork required to be on board the aircraft, you ask your friend where she keeps her Airworthiness Certificate and registration. She pulls out a bag that contains a fuel strainer, a quart of oil, a screwdriver, and an envelope that contains the Airworthiness Certificate and registration certificate. Does this meet the rule? What, specifically, do you want to see when inspecting the Airworthiness Certificate and registration certificate?

8) To return to Element 1a, Privileges and Limitations, the evaluator might ask:

SCENARIO: After the missing placards, you now have to point out that the aircraft registration is expired. Your list of discrepancies on this aircraft is getting

long, and the flight is scheduled to depart the next day. You have another friend that also owns a (insert same M/M). If it is okay with him, can you offer to fly the doctor in that aircraft? She would pay a reasonable per-hour fee and still pay you $800/day for pilot services.

SCENARIO: Suppose this opportunity had not presented itself. After today, you will hopefully be certificated as a commercial pilot. What other types of flying can you do and receive compensation?

9) It is important to note that (other than the ATP and Airplane Type Rating) the test being administered is a practical test, with no formal division between the oral portion and the flight portion of the test (as discussed during the pretest briefing). For this reason, each task must be evaluated carefully. Most tasks, which could appear to be flight tasks, also state that the applicant must demonstrate knowledge on the elements related to that task. For example, Area of Operation II, Task A, Preflight Inspection, element 1 states the following: "Exhibits knowledge of the elements related to preflight inspection, including which items must be inspected, the reasons for checking each item, and how to detect possible defects."

10) The evaluator must accompany the applicant to the preflight inspection. This task cannot be considered satisfactorily accomplished without the applicant explaining to the evaluator which items they must check, the reasons for doing so, and what each would look like if it were malfunctioning.

11) Similarly, Area of Operation II, Task C, Engine Starting, requires the applicant to exhibit knowledge of the elements related to recommended engine starting procedures. This shall include the use of an external power source and starting under various atmospheric conditions. The evaluator may choose to cover these elements during the oral portion of the test, or inside the aircraft. In order to be a complete test, the elements must be evaluated.

12) The scenario must continue throughout the flight portion of the test. For example, after the Area of Operation VII, Navigation, is complete, the evaluator may say that along the way, the doctor's husband wants to drop down and take some photos of their property. At this point, S-turns or turns around a point may be evaluated. Not every task may be worked into the scenario. In this case, suspend the scenario to perform the maneuvers, and continue with the scenario after the maneuvers are complete. For example, the evaluator may provide the scenario that the aircraft has had an electrical malfunction. The scenario will evaluate a system and equipment malfunction, a no-flap landing, and ATC light gun signals. This is just one example of how to incorporate scenarios into the test. All tasks will be tested in the same manner, as much as practical.

C. Tests Based on the ACS.

1) When administering a test based on ACS, the tasks appropriate to the class airplane (Airplane Single-Engine Land (ASEL), Airplane Single-Engine Sea (ASES), AMEL, or Airplane Multiengine Sea (AMES)) used for the test must be included in the POA. The absence of a class indicates the task is for all classes.

2) In contrast to testing based on PTS, a practical test that is administered based on ACS is not required to incorporate each element within a task. Instead, the emphasis is placed on elements that were missed by the applicant on the knowledge test. The POA must include at least one Knowledge element and at least one Risk Management element. The evaluator must ensure that all Skill elements have been evaluated, regardless of how many Knowledge elements and Risk Management elements are tested. Each Knowledge element listed on the airman test report must be evaluated as part of evaluating the task containing those elements.

3) The introduction to the ACS explains the ACS codes. For example:

PA.I.B.K2:
PA = Applicable ACS (Private Pilot–Airplane).
I = Area of Operation (Preflight Preparation).
B = Task (Airworthiness Requirements).
K2 = Knowledge Task Element 2 (Individuals who can perform maintenance on the aircraft, including Airframe and Powerplant (A&P) and Inspection Authorization (IA) roles in aircraft maintenance and inspections).

4) In order to develop a POA individualized to the particular test, the evaluator must review a copy of the applicant's airman test report prior to the test. The ACS codes, reflected on the airman test report, must be tested during the practical test. It is recommended that the evaluator request a copy of the airman test report when the applicant calls to schedule the test. This may also be accomplished by obtaining the applicant's FAA tracking number (FTN) and reviewing the airman test report in IACRA. Having sufficient time prior to the practical test allows the evaluator to thoughtfully tailor their POA to that individual's test.

D. Example Practical Test Based on the ACS.

1) An evaluator is requested to administer a Private Pilot ASEL practical test. During the initial contact with the applicant (or recommending instructor), the evaluator requests a copy of the applicant's airman test report. Upon review, the evaluator notes that the following ACS code is listed on the knowledge test report: PA.I.B.K3. In developing a POA for the practical test, the evaluator refers to the ACS and determines that the applicant has missed questions from the following Knowledge section (see the items indicated with asterisks in Figure 5-17, Sample Task B, Airworthiness Requirements, below):

Figure 5-17. Sample Task B, Airworthiness Requirements

Task	***B. Airworthiness Requirements***	
Reference	14 CFR parts 39, 43, and 91; FAA-H-8083-2, FAA-H-8083-3, FAA-H-8083-25	
Objective	To determine that the applicant exhibits satisfactory knowledge, skills, and risk management associated with airworthiness requirements, including aircraft certificates.	
Knowledge	The applicant demonstrates understanding of:	
	1. General airworthiness requirements and compliance for airplanes.	PA.I.B.K1
	a. Certificate location and expiration dates.	PA.I.B.K1a
	b. Required inspections.	PA.I.B.K1b
	c. Inspection requirements.	PA.I.B.K1c
	2. Pilot-performed preventive maintenance.	PA.I.B.K2
	*3. Equipment requirements for day and night flight including flying with inoperative equipment (approved minimum equipment list (MEL), Kinds of Operations Equipment List (KOEL), required equipment for visual flight rules (VFR) and instrument flight rules (IFR) flight, required equipment, and placards).	PA.I.B.K3
	4. Proving airworthiness (specifics of the aircraft–compliance with Airworthiness Directives (AD) or applicability of Service Bulletins (SB)).	PA.I.B.K4
Skills	The applicant demonstrates the ability to:	
	*1. Locate aircraft airworthiness and registration information.	PA.I.B.S1
	*2. Determine the aircraft is airworthy in a scenario given by the evaluator.	PA.I.B.S2
	*3. Explain conditions where flight can be made with inoperative equipment.	PA.I.B.S3
Risk Management	The applicant demonstrates the ability to identify, assess, and mitigate risks, encompassing:	
	*1. Inoperative equipment discovered prior to flight.	PA.I.B.R1

2) The evaluator must test the applicant on the Knowledge elements that were missed on the knowledge test. In addition, the evaluator must select at least one Risk Management element to evaluate. At the end of the scenario, it must be ensured that all three Skill elements have been evaluated. These required elements are denoted by asterisks in the Skills and Risk Management sections for the Airworthiness Requirements task above.

3) Since the knowledge test reflected that all missed questions were related to the Airworthiness Requirements task, each additional task will require only one Knowledge element and one Risk Management element to be selected for evaluation. In this case, the additional

Knowledge element and Risk Management element are chosen at the evaluator's discretion. The Skill elements in each task must always be evaluated. However, the evaluator administering the practical test has the discretion to combine tasks/elements as appropriate to testing scenarios.

4) Prior to administering the test, the evaluator will provide the applicant with the overall scenario (the reason to take the flight) for the test. In this example, we will use the following scenario: You are taking your mother, father, and grandmother to a wedding in Palm Springs, CA. The wedding begins at 7 p.m. The church is a short 15-minute cab ride from the airport, and you will be returning the same evening. Your mother weighs 145 pounds; your father weighs 195 pounds; and your grandmother weighs 115 pounds. Your parents' gift is a set of dishes, weighing 50 pounds. Thankfully, your grandmother brought a card with cash.

5) The day of the test, the evaluator administers the pretest briefing. She then determines that the applicant is eligible for the test. Once the test has begun, the evaluator begins with Area of Operation I, Task A, Pilot Qualifications, and continues with the scenario, involving the trip for the wedding. She selects Knowledge element 2 (K2) and Risk Management element 1 (R1) for evaluation. These selections were at the discretion of the evaluator, as no codes from the knowledge test report were present for this task. During the development of the POA, the evaluator determines that by selecting K2 and R1, additional questions would be required to satisfy the Skills section (see the items denoted by asterisks in Figure 5-18, Sample Task A, Pilot Qualifications, below).

Figure 5-18. Sample Task A, Pilot Qualifications

Task	***A. Pilot Qualifications***	
Reference	14 CFR parts 61 and 91; FAA-H-8083-2, FAA-H-8083-3, FAA-H-8083-25	
Objective	To determine that the applicant exhibits satisfactory knowledge, skills, and risk management associated with airman and medical certificates including privileges, limitations, currency, and operating as pilot in command (PIC) as a private pilot.	
Knowledge	The applicant demonstrates understanding of:	
	1. Certification requirements, recent flight experience, and recordkeeping.	PA.I.A.K1
	*2. Privileges and limitations.	PA.I.A.K2
	3. Medical certificates: class, expiration, privileges, and temporary disqualifications.	PA.I.A.K3
	4. Documents required to exercise private pilot privileges.	PA.I.A.K4
	5. Title 14 CFR part 68 BasicMed privileges and limitations.	PA.I.A.K5
Skills	* Apply requirements to act as PIC under visual flight rules (VFR) in a scenario given by the evaluator.	PA.I.A.S1
Risk Management	The applicant demonstrates the ability to identify, assess, and mitigate risks, encompassing:	
	*1. Distinguishing proficiency vs. currency.	PA.I.A.R1
	2. Flying unfamiliar aircraft or operating with unfamiliar flight display systems and avionics.	PA.I.A.R2

6) The evaluator has provided the following scenario to the private pilot applicant:

SCENARIO: Your family accompanies you out to the airplane for the preflight. While performing the preflight, an inspector from the FAA introduces himself and says that he wants to provide you with a complimentary ramp inspection. Since you have never experienced this before, you give him a blank stare. He explains that he'd like to see your airman documents. What does he mean?

7) When the applicant has demonstrated a good understanding of airman documents and identification required when exercising private pilot privileges, this element (K2) is complete. If items are omitted, the evaluator will use followup questions.

SCENARIO: The FAA inspector asks if this is a for-hire flight, and you say that it isn't. While checking your medical certificate, he nods, says that it looks good, and hands it back to you. Your mom asks why the FAA cares who is paying for the flight and what that has to do with your medical certificate. How do you explain this to your mom?

SCENARIO: The inspector then asks if you have your pilot logbook with you. Luckily, it's still in your bag. He asks you to show him that you're current. What do you show? (This will cover 14 CFR §§ 61.56 and 61.57.)

8) If the applicant does not mention night currency at this time (the wedding starts at 7 p.m.), the evaluator may ask followup questions such as, "What if you had the ramp check on your return flight? What else would the inspector want to see?"

SCENARIO: Pulling out your logbook, you realize that the last time you flew at night was (fill in a date more than 90 days ago). You're already at the airplane and committed to taking the flight. How do you handle this?

9) The applicant may or may not come up with the idea that he could perform three takeoffs and landings before loading his passengers. This may lead to a discussion about currency vs. proficiency (R1). If not, the evaluator must ask followup questions.

10) While developing the POA, it can be seen that by simply evaluating K2 (the question about the ramp check and checking documents required) and R1 (a newly certificated pilot that is legally current but not necessarily proficient), the Skills portion of this task has not been evaluated in its entirety. ("The applicant demonstrates the ability to apply requirements to act as PIC under VFR in a scenario given by the evaluator.") This is the reason for asking the additional questions about currency and medical certificate privileges and durations.

11) Continuing to develop the POA, the evaluator reviews Task B (see the items denoted by asterisks in Figure 5-17 above).

12) When the evaluator reviewed the applicant's airman test report, they noted the following ACS code: PA.I.B.K3. Therefore, this Knowledge element must be tested. The same procedure applies. Develop the POA to cover all the Knowledge elements, at least one Risk Management element, and then ensure that the entire Skill section has been met.

13) The evaluator continues with the scenario:

SCENARIO: The FAA inspector agrees that your airman documents and currency are in order. They then ask how you determined that the airplane was in an airworthy condition.

14) This scenario will most likely lead the applicant to explain the aircraft documents required to be on board the aircraft, and possibly the status sheet, demonstrating inspection compliance. It evaluates the first Skills element.

SCENARIO: The FAA inspector is satisfied, shakes your hand, and moves on to the next airplane. You continue your preflight. You turn the master switch on, turn on all the external lights, and perform a walk-around. You notice that the landing light is inoperative. What do you do?

15) The applicant is expected to give a thorough explanation of determining whether or not he can legally take the flight with a landing light inoperative and how to properly defer

this item. The applicant may refer to 14 CFR § 91.213, and a discussion must cover equipment requirements for day/night VFR/IFR flight, the Kinds of Operations Equipment List (KOEL), and the proper deferral of inoperative equipment, including placard installation. If the applicant explains the process for deferring without the use of an MEL, the evaluator is then required to ask followup questions that evaluate the applicant's knowledge of the use of an approved MEL. For example:

> SCENARIO: This plan sounds reasonable. However, when you check the aircraft book to find a placard, you notice a Letter of Authorization (LOA) for the use of an MEL, and this N-number is listed on the MEL. How does that change the deferral process?
>
> NOTE: This discussion evaluates K3.

16) The expectation is that the applicant explains that since the flight is not for compensation, he may legally defer it. However, as a newly certificated pilot conducting a night flight with his family on board, the applicant may elect to have the landing light replaced. He has identified the inoperative light as a risk, which he elects to eliminate. If not, the evaluator must ask further questions in order to evaluate his risk management. This discussion evaluates R1.

> SCENARIO: So, you've decided to have the landing light replaced. A woman in the hangar next to your tiedown spot notices your issue. She also owns a (insert M/M) and has a spare landing light. She even offers to install it for you. What are your thoughts? What should you ask her?

17) This easily leads to a discussion about who may perform maintenance on the aircraft, which will evaluate the applicant's knowledge of K2.

> SCENARIO: Suppose that, instead of the landing light, it was your anticollision light that was inoperative. Can we legally take the flight without an operating anticollision light?

18) The applicant then refers back to the rule and determines that it is a no-go item.

> SCENARIO: Your family (particularly your father) is getting anxious because he does not want to be late for the wedding and really wants to go. Is there any way for us to legally take this flight? The navigation lights, landing lights, and recognition lights are all working.
>
> NOTE: This discussion will evaluate K3.

19) The POA has encompassed all of the required Knowledge elements (K2 and K4), and the Risk Management element (R1). The evaluator revisits the Skills section to ensure that elements S1–3 have been evaluated. This task has now been evaluated in its entirety.

20) The scenario must continue throughout the flight portion of the test. For example, after the Area of Operation VII, Navigation is complete, the evaluator may say that, along the way, your mother is excited that she can see her house from the air. She wants to drop down and

take some photos of their property. At this point, turns around a point may be evaluated. Not every task may work into the scenario. In this case, suspend the scenario to perform the maneuvers, and continue with the scenario after the maneuvers are complete. For example, the evaluator may provide the scenario that the aircraft has had an electrical malfunction. The scenario will evaluate a system and equipment malfunction (or several), a no-flap landing, and ATC light gun signals. This is just one example of how to incorporate scenarios into the test. All tasks must be tested in the same manner, to the extent practical.

E. Physical Location of the Designee During a Practical Test.

1) A designee must accompany the applicant in the aircraft during all practical tests in accordance with 14 CFR § 61.45(b)(1)(iii). Except for conducting practical tests in an aircraft that requires a pilot flightcrew of two or more, as provided in subparagraph 5-221F, an examiner is expected to be physically located in the other pilot crewmember station when conducting a practical test in an aircraft that only requires one pilot crewmember. However, it is acceptable for a designee to give the practical test from a designated jump seat or place in the cabin from which the applicant can be adequately observed, provided another pilot, who is qualified to act as the PIC, occupies the other pilot crewmember station. This kind of arrangement is permitted, provided the designee agrees. For a designee to agree to such an arrangement, such factors as aircraft seating configuration, the designee's personal knowledge of the person proposing to occupy the other pilot crewmember station, and the designee's own skills, recent experience, and qualifications should be considered. However, it is normal procedure and expected that the designee occupies the other pilot crewmember station.

2) When a designee agrees to give the practical test from a designated jump seat or place in the cabin from which the applicant can be adequately observed, the designee must conduct a preflight briefing with the applicant and the other pilot about safety precautions, procedures, duties, and responsibilities of each crewmember before beginning the flight portion of the practical test.

3) For sport pilot examinations, a Sport Pilot Examiner (SPE) must accompany the applicant in the aircraft during all practical tests in accordance with 14 CFR § 61.45(b)(1)(iii) unless the aircraft only has one seat. If the applicant presents a single-seat aircraft, the examiner can proceed with the practical test. The pilot will have a limitation placed on their sport pilot certificate, which limits operation to a single-seat LSA; they will not be authorized to carry passengers. The SPE must refer to the appropriate PTS or ACS to ensure the required maneuvers are performed for single-pilot aircraft.

F. Designee Station in an Aircraft Requiring a Flightcrew of Two or More. During practical tests given on aircraft requiring a flightcrew of two or more, the designee should give the practical test from a designated jump seat or place in the cabin from which the flight can be adequately observed. When a designee conducts a practical test from a jump seat or station in the cabin, a pilot who is qualified to act as PIC in that aircraft must occupy a pilot seat.

1) This arrangement allows the designee to devote full attention to the practical test rather than being involved with performing the duties of a flightcrew member. It also allows the designee to assess the command ability of the applicant and to observe crew coordination.

2) This is not intended to preclude a designee from electing to occupy a pilot seat during the practical test. Consideration should be given to such factors as aircraft seating configuration, the designee's personal knowledge of the person proposing to occupy the pilot seat, and the designee's skills, recent experience, and qualifications.

5-222 BRIEFINGS.

A. Pretest Briefing.

1) Put the applicant at ease (small talk, etc.).

2) Advise the applicant of available comfort facilities (restrooms and breaks).

3) Confirm the type of practical test or retest.

4) Provide a casual overview of the test.

5) Verify that required equipment (e.g., hood, charts, etc.) is available.

6) Verify that the applicant is familiar with the PTS or ACS, as appropriate, and that those are the standards to which the applicant will be tested. (Perfection is not the standard.)

7) Advise the applicant that you will be using a POA and that you will be taking notes throughout the test.

8) Advise the applicant that oral questioning will continue throughout the evaluation, to include the flight portion of the test.

9) Advise the applicant of any applicable fees and of the three possible outcomes of the test:

a) Temporary Airman Certificate.

b) Notice of Disapproval of Application.

c) Letter of Discontinuance.

10) Ask the applicant if they have any questions.

11) Refer to the appropriate 14 CFR sections and the sections of this chapter to determine that the applicant is eligible for the test.

12) Once eligibility is determined, collect the fee and advise the applicant that the test has begun.

B. Preflight Briefing.

1) Profile of the flight test (to include departing on the cross-country that the scenario provided, if applicable).

2) Who is PIC (14 CFR § 61.47)?

3) Cannot allow a violation to occur: how close to airspace, etc., will be allowed (verbal intervention by evaluator is unsatisfactory performance).

4) Emergencies, actual and simulated.

5) Feathering and unfeathering in a multiengine airplane (only if applicable).

6) Autorotation procedures (helicopter only).

7) Transfer of controls.

8) Transitioning from simulated IFR to VFR (only if applicable).

9) Collision avoidance (certificated flight instructor (CFI) applicant required to instruct).

10) Checklist usage.

11) Clearing the area before maneuvers.

12) Advise that oral questioning and note taking will continue.

13) Advise that stated tolerances include risk management decisions.

14) Advise how unsatisfactory performance will be handled:

a) May continue when both parties agree.

b) How and when the applicant will be notified.

c) Describe under what circumstances a maneuver might be repeated.

15) Ask the applicant if they have any questions.

C. Postflight Briefing.

1) Ensure that the applicant is debriefed in private. (The recommending flight instructor or chief/assistant chief may also want to attend. With the consent of the applicant, this is appropriate.) The intent is to not discuss the test publicly.

2) Reaffirm the outcome of the test.

3) Use notes taken to debrief performance (highlight areas that were above standard).

a) Airman satisfactory:

- Complete paperwork.
- Have the airman sign the Temporary Airman Certificate.
- Advise that the temporary certificate is valid for 120 days.
- Advise the airman what to do if they do not receive their permanent airman certificate.
- Offer to sign the airman's logbook.

b) Airman unsatisfactory:

- Allow the applicant time alone while paperwork is completed.
- Use the PTS or ACS to explain reasons for disapproval.
- Advise the applicant of timeframe to retest and to keep the Notice of Disapproval of Application.
- Return the knowledge test to the airman (if applicable).
- Offer to sign the airman's logbook (not required).

4) It is recommended that the evaluator contact the instructor for a debrief on the applicant's performance.

5-223 COMBINATION PRACTICAL TESTS. Combination practical tests may occur when an applicant takes a practical test for multiple certificates and/or ratings at the same time (e.g., a Private Pilot Certificate and an instrument rating, or an ATP Certificate and a type rating). Evaluators should treat a combined certificate and/or rating evaluation as one practical test, requiring only one application and resulting in only one temporary certificate, disapproval notice, or Letter of Discontinuance, as applicable. Failure of any task will result in a failure of the entire test and application.

A. Combined Practical Tests Authorized or Required by Regulation or Order:

1) Private, Instrument, Category, Class, and Type Rating (refer to 14 CFR § 61.63).

2) Commercial, Instrument, Category, Class, and Type Rating (refer to 14 CFR § 61.63).

3) ATP Category, Class, and Type Rating (refer to 14 CFR § 61.63).

4) Private and Instrument (refer to 14 CFR § 61.65).

5) Any certificate level airplane land and sea in an amphibious aircraft type rating (specifically called out in the ATP/type rating ACS).

6) Pilot certification and medical flight test (see Volume 5, Chapter 8, Section 1).

7) Pilot certification/type ratings and 14 CFR parts 121 and 135 proficiency checks (see Volume 5, Chapter 1).

8) Other combinations may be possible even if they are not specifically called out in the regulation (i.e., multiengine instructor and instrument instructor airplane).

NOTE: Combination tests should be limited to pilot categories, class, and ratings resulting in a pilot certificate or flight instructor categories, class, and ratings resulting in a flight instructor certificate.

B. Authorization. In order to conduct a combination practical test, evaluators other than ASIs must have the combination test authorization on their Certificate Letter of Authority (CLOA). This does not apply to private pilot and instrument rating or ATP and type rating combination tests, which may be conducted by any evaluator authorized to give those tests individually.

C. Test Prerequisites. All prerequisites to include applicable certificate criteria and aeronautical experience are required to be met for each certificate or rating applied for. For example, 14 CFR § 61.109(a)(4) requires private pilot applicants to have 3 hours of flight training in preparation for the practical test within the preceding 2 calendar months from the month of the test. For the instrument rating, 14 CFR § 61.65(d)(2)(i) also requires 3 hours of flight training within 2 calendar months before the date of the practical test. So for an applicant wishing to take the combined private pilot and instrument rating practical test, they will need a total of 6 hours: 3 hours for the private pilot rating and 3 hours for the instrument rating.

D. POA. Evaluators conducting a combined practical test will ensure that their POA is comprehensive and includes all of the tasks/elements of each certificate or rating being tested.

E. Testing. Practical tests utilizing multiple testing documents (ACS or PTS) with duplicate tasks (i.e., steep turns in both documents) would use the more stringent standards (e.g., ATP standard over Commercial). When demonstration of a task repeated in two different documents differentiates between visual and instrument conditions, evaluators must test both tasks. In a practical test utilizing one testing document (e.g., private pilot airplane single-engine land and sea) the evaluator will ensure that all common tasks are evaluated as well as those tasks that are unique to each class rating.

F. Briefing. Evaluators and applicants should discuss the pros and cons of conducting a combined practical test. Evaluators must ensure that the applicant clearly understands that if combining practical tests, a failure of a task or element of one certificate or rating will result in a failure of all certificates or ratings tested for.

G. Application. The applicant will complete FAA Form 8710-1 for the combined practical test on one application. All of the applicable boxes in Section I, Application Information, will be marked and the "Specify Other" box will state "Combination Test." In the "REMARKS" section on the back of the application, the evaluator will make a clear statement as to exactly what combination was tested so there will be no confusion when the file arrives at AFB-720. Include the appropriate knowledge tests, since there may be more than one with a combination practical test.

NOTE: Currently the only path available in IACRA is for an original ATP with a type rating. All other combination practical tests must be submitted via a paper application.

NOTE: Depending on the combination of tests given, it may be necessary to submit a continuation sheet outlining the hour requirements and how they were met for each certificate and/or rating(s) tested when Section III, Record of Pilot Time, does not adequately capture the necessary information for the tests given. See Figure 5-19, Sample FAA Form 8710-1, Airman Certificate and/or Rating Application—Combination Test.

H. Discontinuance. Consistent with 14 CFR § 61.43(e) and (f), there is no difference when conducting a combination test. The evaluator will issue a Letter of Discontinuance that lists only those areas of operation and/or tasks the applicant successfully completed. The evaluator must ensure the Letter of Discontinuance indicates the nature of the combined test by clearly listing the certificate and/or rating of the practical test in which credit was issued.

I. Disapproval Notice. The evaluator will list the area(s) of operation in which the applicant did not meet the standard, any area(s) of operation not tested, and the number of practical test failures on the Notice of Disapproval (FAA Form 8060-5). The evaluator should also list the tasks failed or tasks not tested within any unsatisfactory or partially completed area(s) of operation. Failure of any task will result in a failure of the entire test and application.

J. Temporary Airman Certificate. Complete as normal. Add remarks to the back of FAA Form 8710-1 to clarify exactly what tests were completed.

K. Retesting After a Failure. At the applicant's discretion, the test can be reattempted as a combination test or can be conducted as individual tests. If the applicant chooses to split the tests, evaluators must ensure that only applicable and valid credit listed on the Notice of Disapproval be considered during subsequent retest(s) in accordance with 14 CFR § 61.49.

NOTE: Evaluators have the discretion to decline conducting a combination practical test unless it is specifically mandated by regulation.

L. Aircraft. Multiple aircraft may be utilized when conducting a combination practical test. Each aircraft provided for the practical test must meet the requirements as outlined in 14 CFR § 61.45. Enter each aircraft used in section IIA, box 1; in the Designated Examiner or Airman Certification Representative Report; and in the "REMARKS" section, as needed.

Airman Certificate and/or Rating Application

I. APPLICATION INFORMATION (Mark 'X' in all the blocks applicable to the certificate or rating for which you are applying or for the information you submit to validate certain certification requirements):

Certificates

Pilot: ☐ Student ☐ Recreational ☐ Private ☒ Commercial ☐ ATP-Restricted ☐ ATP
Instructor: ☐ Flight ☐ Ground

Ratings

Category and/or Class: ☐ ASE ☒ AME ☒ Land ☐ Sea ☐ Helicopter ☐ Balloon ☐ Glider ☐ Gyroplane ☐ Airship ☐ Powered-Lift
Instrument: ☒ Airplane ☐ Helicopter ☐ Powered-Lift
Ground Instructor: ☐ Basic ☐ Advanced ☐ Instrument
Type Rating: ☒ Added Rating

Flight Instructor Recency/Other Information/Requests

☐ Initial ☐ Reexamination ☐ IPL
☐ Recency ☐ Reissuance ☐ Instrument Proficiency Check
☐ Reinstatement ☐ Flight Review ☐ Medical Flight Test
Specify Other: Combination Test ☐ Limitation Removal

A. Name (Last, First, Middle)	B. SSN (US Only)	C. Date of Birth (MM/DD/YY)	D. Place of Birth (City and State) or (City and Country)
Smith, John, Doe		04/03/2000	Minot, ND

E1. Residential Address (Including City, State, Zip Code, and Country)	E2. Mailing Address (This address will be printed on the permanent airman certificate, if different than block E1.)	F. Citizenship / Nationality	G. Do you read, speak, write, & understand the English language?
52 Main St. Minot, ND 58701		☒ USA ☐ Other Specify:	☒ Yes ☐ No

H. Height (inches)	I. Weight (pounds)	J. Hair Color	K. Eye Color	L. Sex
67	180	Brown	Blue	☒ Male ☐ Female

M. Do you hold, or have you ever held an FAA pilot certificate, including revoked certificates? (Note: A student pilot certificate is a pilot certificate.)	M1. Grade of Certificate	M2. Certificate Number	M3. Date Issued
☒ Yes ☐ No	Commercial	1234567	01/01/2023
N. Do you hold, or have you ever held a Medical Certificate?	**N1. Class of Certificate**	**N2. Name of Medical Examiner**	**N3. Date Issued**
☒ Yes - FAA ☐ Yes - Foreign ☐ Yes- Military ☐ No	Second	Dr. William Jones	12/07/2022

O. Have you ever been convicted for violation of any Federal or State statutes relating to narcotic drugs, marijuana, or depressant or stimulant drugs or substances? ***Do not include alcohol offenses involving motor vehicle mode of transportation as those offenses are covered on the FAA Form 8500-8, Airman Medical Application Form.*** ☐ Yes ☒ No — O1. Date of Final Conviction

II. CERTIFICATE OR RATING APPLIED FOR ON BASIS OF:

A Completion of Test or Activity

1. Aircraft to be used (If flight test required)	2. Total time in this aircraft and/or approved FFS or FTD (hours): a. Flight Time	b. As Pilot-in-Command
BE-90	120	0

B U.S. Military Competence or Experience

1. U.S. Military Service	2. Date Rated in U.S. Military	3. Rank or Grade

4. List Military aircraft for which you have:	a. logged pilot time or provided flight instruction (IP) (make and model)	b. passed an Instrument Proficiency Check (Pilot or CFI) - (make and model)

C Graduate of an Approved Course

1. Training Agency or Training Center:	1a. Name	1b. Location (City and State)	1c. Certification Number	1d. Part 142?
				☐ Yes ☐ No

2. Curriculum From Which Graduated (Level, Category, and Class and/or Type Rating)	3. Date

D Holder of Foreign License

1. Country that Issued the Foreign Pilot License	2. Grade of Foreign Pilot License	3. Foreign Pilot License Number

4. Ratings Held on Foreign Pilot License (FAA equivalent only – e.g. ASEL, AMEL, Type rating, etc.)

E Air Carrier Training Program

1. Name of Air Carrier	2. Date Training Began	3. Accomplished Training Program
		☐ Initial ☐ Upgrade ☐ Transition ☐ Recurrent

III. RECORD OF PILOT TIME ***(Do not write in the shaded areas)***
